Electricity Price Outlook for January 2020

By John Howley
Senior Economist

Office of Technical and Regulatory Analysis
District of Columbia Public Service Commission

The Office of Technical and Regulatory Analysis presents the outlook for wholesale electricity prices each month. This assessment considers trends in electricity futures markets as well as *forecasted weather, economic growth, and input fuel prices.*

**Key Points in this Month’s Outlook**

- On June 1st, new, lower Standard Offer Service ("SOS") electric rates took effect resulting in a 5.1 percent average decrease for residential customers and 3.8 percent average decrease for small commercial customers.

- Plentiful natural gas in the PJM region is lowering wholesale electricity prices.

- Natural gas now exceeds coal as a generation fuel source in the PJM region.

**Wholesale Electricity Futures Market**

Contracts to deliver electricity in future months are traded for the multi-state region that is served by regional transmission operator PJM Interconnection and includes the District of Columbia. Figure 1 below shows the futures contract “price strips” through February 2021 as settled on December 11, 2019, *(blue line)*, and on January 21, 2020, *(red line).*

Because electricity cannot be easily stored, the effect of seasonal temperature changes on the price of future delivery contracts stands out sharply, with yearly peaks in the hot summer months and cold winter ones. Wholesale prices rise to incentivize high-cost generators to turn on their power plants to meet the high demand for electricity to run air conditioning on hot summer days and heating systems on cold winter days.

---

1 See PJM Western Hub Peak Calendar-Month Real-Time LMP Swap Futures; CME Group.
In Figure 1 above, the red line shows trading values for futures contracts on January 21, 2020, revealing that price expectations for all months are below last year’s levels. The dashed purple line shows the trading values for the “price strip” from one year ago (January 17, 2019). The futures contract price for February 2020 has dropped significantly from the level of one year ago (see black arrow). The trend of winter prices exceeding summer prices continues.

Price expectations during the “shoulder months” are below where they were a year ago. The green arrows (see Figure 1 above) point to the “shoulder months” of April 2020 and October 2020. During these months, temperatures are moderate and demand can be met from less expensive generation like nuclear and wind.

The green line in Figure 2 (below) illustrates how investors have responded to the unusually cold winter weather experienced during the “Polar Vortex” of January 2014, the February 2015 cold snap, and January 2019 -- as they form expectations about the price of electricity in coming winter months. In May 2014, the price of a MWh for delivery in January 2015 closed at $79.30. Investors’ fears about the risk of January generation outages seem to be moderating and have returned to pre-Polar Vortex levels. The most recent price for January 2021 delivery is $41.55 – a five percent decrease from the previous month.
Behind these price movements for January futures contracts lie the extraordinary demands for electricity during January 2014 when five of the 10 highest winter demands for electricity ever recorded in the PJM region occurred. PJM reports that these January 2014 cold-weather events resulted in an unusually high level of “forced outages” of generators serving the PJM system; this created a “shortage effect” that drove wholesale prices temporarily higher.

Progress made by PJM in managing extreme winter peak demand was demonstrated during January 2018 when usage achieved levels within the “PJM Top Ten Winter Peaks” (see figure below). PJM President Andy Ott told the U.S. Senate Committee on Energy and Natural Resources on January 23, 2018, that “Preliminary data shows that overall forced outages during the peak demand hour of the recent cold snap were about half what they were during the Polar Vortex.”

According to a preliminary report, on Thursday, January 31, 2019, at 8 a.m., PJM experienced a peak demand of 139,452 MW; this amounts to the fourth-highest recorded peak. Forced outages by generators were only slightly greater than normal and large price swings were avoided, despite the shutdown of a generating unit at PSE&G’s Salem

---

nuclear plant in New Jersey early Thursday after ice formed on the screens protecting its water intake, limiting the flow needed to cool the reactor.6

**Retail Residential Electricity Prices**

The U.S. Energy Information Administration’s (EIA) *Short-Term Energy Outlook (STEO)* reports that retail residential electricity prices are expected to be flat in 2020 nationwide and a two percent increase is projected in 2020.7 Factors other than generation costs are included in the prices reported by EIA, including the cost of continued investment in transmission and distribution infrastructure.

On February 27, 2019, the Public Service Commission of the District of Columbia approved the results of the annual competitive auction for new electric generation rates for default service, called Standard Offer Service or SOS, which went into effect on June 1, 2019. As a result of a competitive auction overseen by the Commission, on average, the rate for SOS (which consists of the generation and transmission price) for a residential customer will decrease by about $3.78 per month for the average user of 632 kWh/month. The residential SOS customer's rate during the summer will decrease from 6.4 cents per kWh to 6.1 cents per kWh while their winter rate will decrease from 7.2 cents per kWh to 6.3 cents per kWh. On average, the rate for small commercial SOS customers will decrease about $7.95 per month for the average user of 1,602 kWh/month. Overall, residential customers will face an average SOS rate decrease of 5.1 percent, while small commercial customers will face an average rate decrease of 3.8 percent.8

The following sections provide a brief discussion of some of the factors affecting this month’s outlook, including the three-month weather forecast, the overall economic outlook, and the prices of fuels used in power generation.

**Weather Outlook**

Sea-surface temperatures in the equatorial Pacific Ocean influence weather patterns across North America; these so-called La Niña/El Niño conditions are the primary factor in the three-month temperature outlook which, in turn, impacts investor expectations about future electricity prices.

The National Oceanic and Atmospheric Administration’s August 8th *El Niño* watch indicates that ENSO-neutral is favored through Northern Hemisphere spring 2020 (~60% chance), continuing through summer 2020 (~50% chance).9 NOAA notes that, with the end of *El Niño* conditions, there is some chance of above-normal average temperatures in the

6 “Cold weather forces Salem nuclear unit offline as owner PSE&G presses for subsidies,” *Utility Dive*, February 1, 2019.
7 *January 2020 Short-Term Energy Outlook (STEO)*; Table 7c; http://205.254.135.24/forecasts/steo/.
8 Formal Case No. 1017; Order No. 19838; February 27, 2019.
mid-Atlantic region through the February-March-April. NOAA expects normal precipitation during the next three months in the mid-Atlantic region.

Heating-degree days measure the demand for heating during the winter. EIA reports that heating degree days in our region are projected to be nine percent higher in 2020 than in 2019. Projected heating degree days for 2020 are close to the ten-year average.

Cooling-degree days measure the demand for air conditioning during the summer. EIA projects cooling-degree days in the Census region that includes the District of Columbia will be three percent lower in 2020 than the ten-year average. The projection for summer 2020 is twelve percent lower than 2019. The long-term warming trend continues.

Economic Growth and Electricity Consumption

The outlook for economic activity in 2020 remains one of moderate growth. Real (inflation-adjusted) gross domestic product (GDP) grew by 2.9 percent in 2018 and is projected to grow by 2.3 percent in 2019 and by 2.0 percent in 2020. Economic growth is unlikely to affect electricity price trends unless it is sustained above three percent.

EIA forecasts that nationwide residential electricity sales (measured in millions of kilowatthours per day) will be flat in 2020, followed by no change in 2021. Nationwide electricity sales for all sectors will be flat in 2020, with little increase projected in 2021.

Fuel Prices

In recent years, the cost of fuels for electricity generation has been restrained, with the exception of petroleum-based fuels where the market remains volatile in both directions. This moderate trend is driven by historically low natural gas prices and moderate economic growth. The cost of natural gas for generation is projected to remain below the $3 level in 2020 and 2021.

Petroleum

Brent crude is forecast to average $65 per barrel in 2020 and $68 per barrel in 2021, compared to an average of $64 per barrel in 2019. EIA expects retail gasoline to increase.

average $2.63 per gallon in 2020 and 2021, compared to $2.60 per gallon in 2019.\textsuperscript{18} The outlook for international crude oil prices has dimmed recently along with growth expectations in the wake of the coronavirus outbreak in China, a major source of crude-oil demand.\textsuperscript{19}

U.S. shale oil producers continue to raise their production, acting as a countervailing force to OPEC. Annual U.S. crude production averaged 12.2 million b/d in 2019, an increase of 1.3 million b/d over 2018. EIA projects an average rate of production of 13.3 million b/d in 2020. In 2021, EIA projects production averaging 13.7 million b/d – up from 8.9 million b/d in 2016 and well surpassing the 1970 record of 9.6 million b/d. Records continue to be set for annual U.S. crude production.\textsuperscript{20}

The latest Monthly \textit{Drilling Productivity Report} from the EIA shows a fluctuation in crude oil output and a decline in gas production in the U.S. shale-producing basins surveyed (see Figure 3 below).\textsuperscript{21} Output in shale regions depends on high rates of drilling activity which investors are no longer willing to finance as generously as they have in the past.\textsuperscript{22} Figure 3 illustrates how shale oil and gas production have declined in the past six months.

\begin{itemize}
\item \textsuperscript{18} STEO, Table 2.
\item \textsuperscript{19} “Commodities Fall Alongside Global Stocks With Coronavirus Spreading,” \textit{Wall Street Journal}; January 23, 2020.
\item \textsuperscript{20} STEO, pages 1 and Table 4a.
\item \textsuperscript{21} See EIA’s monthly \textit{Drilling Productivity Report}; \url{http://www.eia.gov/petroleum/drilling/pdf/dpr-full.pdf}.
\item \textsuperscript{22} “Schlumberger Plans U.S. Pullback as Shale Oil Drillers Struggle;” \textit{Wall Street Journal}, January 17, 2020.
\end{itemize}
Net liquid fuel imports to the United States peaked at over 60 percent of domestic supply in 2005 and then fell to two percent in 2019 – the lowest level since 1970; this represents a major shift in the structure of world oil markets. EIA projects the net import share to fall even further -- to minus four percent in 2020 – meaning that the United States is now a net exporter of petroleum fuels. This trend is projected to continue in 2021. See Figure 4 below.

![Figure 4: Import Share of U.S. Petroleum Consumption](image)

Only time will tell whether growing domestic petroleum output will continue to moderate the price of crude oil. Petroleum fuels supplied less than one percent of the PJM generation during 2019.

**Natural Gas**

Natural gas prices are significantly below 2008 levels when the Henry Hub price averaged $8.94 per one million British Thermal Units (MMBtu). Recently, the spot price has recovered from the lows reached in early 2012 when it briefly touched $2 per MMBtu.

Natural gas prices in the spot market result from the interaction of trends in domestic production, growing gas-fired generation of electricity, and expected winter heating needs; expanding natural gas exports may impact prices in the future. Record domestic production has offset rising exports and above-average usage. EIA expects Henry Hub spot prices to average $2.33/MMBtu in 2020 and $2.54 in 2021. Natural gas prices are now projected to remain below 2018 levels through 2021.

---

23 STEO; Table 4a. *EIA Monthly Energy Report*; July 2018; Table 3.1; [http://www.eia.gov/totalenergy/data/monthly/pdf/mer.pdf](http://www.eia.gov/totalenergy/data/monthly/pdf/mer.pdf).

24 STEO, Table 4a.

25 STEO: Table 7d.

26 EIA; *2011 Annual Energy Outlook*; page 115.

27 STEO; page 2.
The Henry Hub spot price is more volatile than the cost of natural gas actually paid by electricity generators where long-term contracts and hedging are typically involved. EIA projects that the cost of natural gas for power generation will remain below $3 in 2020 and 2021.  

U.S. liquefied natural gas (LNG) export capacity is growing. Sabine Pass LNG (Texas) began export operations in February 2016; and commercial exports from Dominion Energy’s Cove Point LNG in Maryland have begun. EIA reports that Cove Point utilized 94 percent of its capacity in May. EIA expects exports to grow faster than domestic production, possibly putting modest upward pressure on natural-gas prices; EIA expects LNG export capacity to grow through 2021.

28 SEEO; Table 7a.
30 See Table 5a and https://www.eia.gov/todayinenergy/detail.php?id=37732. "Bcf/d" is billion cubic feet per day.
The gap between projections for LNG export capacity (above) and projected amounts (below) suggests that not all of the new capacity under construction is currently committed by supply contracts.

Regional variations in natural-gas prices also impact regional wholesale electricity markets like PJM – influenced by local gas production and the availability of gas pipeline transportation capacity. The Wall Street Journal reports that plentiful natural gas in the Appalachian region has fueled an expansion of gas-fired generation and depressed electricity prices in the PJM wholesale market. This is confirmed in a brief analysis from EIA: Natural-gas fired plants are being added and used more often within the region served by PJM Interconnection. EIA explains that gas-fired capacity has been growing in the region and that gas-fired generation has a rising “capacity factor” which combine to increase megawatthours generated by natural gas.

The long-term impact of inexpensive natural gas can be seen easily in PJM wholesale electricity price trends. “Figure 3-24” (below) shows the monthly and annual average load-weighted LMP for January 1999 through September 2019. Annual average LMP has declined since natural-gas prices peaked in 2008. (Note the January price spike in 2018, the result of extreme winter cold.)

---

32 U.S. EIA; Natural-gas fired plants are being added and used more in PJM Interconnection; October 17, 2018. https://www.eia.gov/todayinenergy/detail.php?id=37293.
33 Independent Market Monitor; Q3 2019 State of the Market Report for PJM January through September (November 14, 2019); page 151. LMP means “locational marginal price” which refers to the price-setting methodology used in PJM’s wholesale electricity market.
Natural gas accounted for 36.2 percent of the PJM generation fuel mix during 2019, a significant increase from 16.4 percent in 2014.\textsuperscript{34}

**Coal**

Coal has been displaced by natural gas, wind, and nuclear in electricity generation. Nationwide, coal consumption in electric power generation has not returned to the peak level of 2007. EIA estimates that coal production was 690.1 million short tons (MMst) in 2019, it is projected to fall by 13.5 percent to 596.6 million short tons in 2020.\textsuperscript{35}

EIA reports that the delivered price of coal for power generation peaked at $2.39 in 2011. EIA estimates the delivered price of coal averaged $2.05 per MMBtu in 2019, and forecasts $2.10 per MMBtu in 2020 and 2020.\textsuperscript{36}

In the PJM wholesale market that serves the District of Columbia, the cost of natural gas is a more important factor than coal in setting the overall level of wholesale market

\textsuperscript{34} STEO; Table 7d.
\textsuperscript{35} STEO; Table 6. Historical data can be found at http://www.eia.gov/totalenergy/data/annual/pdf/sec7_9.pdf. See also The Brattle Group; Coal Plant Retirements: Feedback Effects on Wholesale Electricity Prices; November 2013; http://www.brattle.com/system/news/pdfs/000/000/584/original/Coal_Plan\_Retirements\_Feedback\_Effects\_on\_Wholesale\_Electricity\_Prices.pdf.
\textsuperscript{36} STEO; Table 7a.
prices for electricity.\textsuperscript{37} Coal represented 23 percent of the PJM generation fuel mix during 2019, down from a recent high of 45.2 percent in June 2014.\textsuperscript{38} As noted above, the natural gas share of PJM generation is rising, in line with national trends. Coal has fallen to third place behind nuclear and natural gas a share of the PJM fuel mix.

Across the United States, coal generation plants are being retired and new natural gas-fired generation plants are being built, mirroring trends in the PJM region. EIA projects that the natural gas share of electricity generation nationwide will rise from 37 percent in 2019 to 38 percent in 2020. Coal's share of generation will fall to 21 percent in 2020, down from 24 percent in 2019.\textsuperscript{39} EIA's forecasted generation shares for coal and natural gas are very sensitive to the natural-gas price forecast.

**Renewables**

Nationwide, EIA projects that generation of electricity from all nonhydropower renewables will provide more than 11 percent in 2019 and may reach exceed 12 percent in 2020.\textsuperscript{40} Wind generated more electricity than hydropower for the first time in 2019. Generation from utility-scale solar is projected to rise by 73 percent between 2019 and 2021.\textsuperscript{41}

Renewable Portfolio Standards (“RPS”) enacted by many states are stimulating the rapid growth of solar in the PJM market. This stimulus will intensify as scheduled increases will raise the RPS for solar in coming years, as shown in "Table 8-12" below.\textsuperscript{42}

Trends in Generation Fuel Mix

EIA’s monthly *Short-Term Energy Outlook* includes forecasts of the fuel sources for electricity generation (natural gas, nuclear, renewables, and so forth). Nationwide, the shares generated from natural gas and renewables are projected to increase while coal’s share will decline. Hydro and nuclear are not adding capacity so their shares remain relatively stable.

![Electric Generation Fuels, United States](source:EIA, STEO, Table 7d.)
EIA provides the same information for individual wholesale market regions such as PJM (see below). PJM reflects the national trends with some differences.

- Renewables are a smaller share of the generation mix in PJM compared to the nation as a whole; their share is also growing more slowly.
- The natural-gas share is growing in PJM and is projected to be larger than the U.S.-wide share by 2021.
- Coal will be a smaller share of PJM generation than nationwide by 2021.
- PJM has much less hydro capacity than the U.S. overall.
